Comparative Analysis of Four Scholarly Research Platforms

This report compares four widely used scholarly platforms: AD Scientific Index, Scopus, ORCID, and Web of Science. The comparison focuses on their purpose, coverage, identifiers, metrics, transparency, and practical use. No individual researchers are discussed. Each platform serves a different role: researcher identification, bibliographic indexing, citation analysis, or institutional evaluation. They complement rather than directly replace one another.

Property	AD Scientific Index	Scopus	ORCID	Web of Science
Primary purpose	Research performance rankings and institutional analysis	Bibliographic database with citation indexing	Persistent researcher identifier and profile	Citation index and research analytics
Content	Profiles and rankings	Publications, citations	Researcher identity and works	Indexed scholarly literature
Researcher ID	Platform profile	Scopus Author ID	ORCID iD	Researcher Profiles integration
Citation metrics	Aggregated indicators	Extensive citation metrics	Not primary focus	Citation analytics
Ranking capability	Yes	Limited	No	Institutional/journal analytics
Identifier persistence	Moderate	Platform-specific	Global persistent ID	Platform-specific
Typical users	Universities, evaluators	Researchers, librarians	Researchers, publishers	Institutions, analysts
Strength	Accessible rankings	Broad literature coverage	Open identity standard	High-quality curated indexing
Limitation	Depends on external sources	Subscription	No citation database	Subscription

Overall Positioning

ORCID is primarily an identity infrastructure rather than an evaluation platform. Scopus and Web of Science are comprehensive citation-indexing systems frequently used for literature discovery and bibliometric analysis. AD Scientific Index emphasizes comparative rankings derived from available scholarly metrics. Because their objectives differ, they are best viewed as complementary components of the scholarly ecosystem instead of direct competitors.
